Merging two DOIDs

Disease A
Disease B

-- merging Disease A (e.g. T lymphocyte deficiency) into Disease B (e.g. T cell deficiency)
    -- to Disease B record:
        -- add DOID of Disease A as (has alternative id) alt_id
        -- add name of Disease A as EXACT synonym
        -- review and then add Disease A's xrefs, definition xrefs, synonyms, subset
        -- review and combine definitions

    -- to Disease A record
      - rename 'name' to obsolete name, e.g. obsolete Disease A
      - add annotation - owl:deprecated - Literal tab, type: true
      - remove all xrefs, definitions, synonyms, subsets
    --only leave id, name_space and name (label)
      -- lastly, remove all logical definitions (EQ and SubClassOf), and parents (SubClassOf)
